

# SIMRAN MANN

Surrey, BC • [sma308@sfu.ca](mailto:sma308@sfu.ca) • [linkedin.com/simran-m](https://linkedin.com/simran-m) • [github.com/simran-mann](https://github.com/simran-mann)

## EDUCATION

<b>Simon Fraser University</b> <i>Bachelor of Applied Science – Computing Science</i>	Sept 2022 – Dec 2026 GPA: 4.04/4.33
<b>Relevant courses:</b> Distributed Systems, Operating Systems, Compilers, Computer Architecture	

---

## TECHNICAL SKILLS

**Programming Languages:** C/C++(multithreading, atomics, STL, RAII), Python, x86-64 Assembly, Bash  
**Systems & Concurrency:** POSIX threads, std::thread, mutexes, atomics, MPI, lock-free progress guarantees  
**Tools & Platforms:** Linux/Unix, Git, Docker, LLVM, STM32

---

## PROJECTS

<b>Parallel and Distributed Graph Algorithms</b>	Sept – Dec 2025
--	-----------------

- Implemented parallel PageRank and Triangle Counting graph algorithms using both std::thread for shared memory systems, and MPI across nodes in a cluster
- Scaled implementations from single-node multithreaded execution to distributed MPI-based execution, optimizing message-passing to reduce synchronization overhead
- Evaluated vertex-based, edge-based, and dynamic task decomposition approaches to improve load balance and inter-process communication

<b>Concurrent Data Structures Benchmarking</b>	October 2025
--	--------------

- Implemented non-blocking queues, stacks, and sets using lock-free linked lists
- Benchmarked these data structures under multi-producer/multi-consumer workloads to analyze contention
- Addressed ABA problems via version-tagged pointers and Compare-and-swap (CAS)

<b>C Language Compiler</b>	June - August 2025
----------------------------	--------------------

- Developed a compiler for a C-like language using Flex/Bison and LLVM IR, including SSA-form code generation and short-circuit evaluation
- Gained practical experience with parsing, semantic analysis, and machine code generation pipelines
- Built C runtime and Python scripts to automate testing, validating compilation and execution of code

<b>Custom Memory Allocator</b>	July 2024
--------------------------------	-----------

- Built malloc/free implementation from scratch with Best Fit, Worst Fit, and First Fit memory allocation algorithms
  - Implemented memory compaction to reduce fragmentation and improve allocation performance
  - Managed free and allocated memory blocks using custom linked list data structures
- 

## EXPERIENCE

<b>SFU Robot Soccer – Firmware Developer</b>	May 2025 – Present
--	--------------------

- Designed and implemented the basestation firmware, enabling robots to receive and parse commands through UART from the software team and relay commands via LoRa to the motherboards for each robot
- Contribute to motherboard firmware development and testing, ensuring real-time task scheduling and responses
- Collaborate in a multidisciplinary team spanning firmware, software, and electronics to achieve robust match-ready performance for the robots

<b>NETGEAR - Orbi Software Test Engineer</b>	Sep 2024 – April 2025
--	-----------------------

- Developed a Python tool to parse UART serial output for automated device testing and debugging
- Automated the main test plan, reducing test time from a full day to 2 hours
- Verified device behaviour over TCP and UDP traffic, validating protocol-level correctness, latency, and stability during product verification
